8.7.3 Measurability

There are two natural sigma-algebras on a product space: the borel sigma algebra, generated by open sets in the product, and the product sigma algebra, countably generated by products of measurable sets along finitely many coordinates. The second one is defined and studied in `Finite_Product_Measure.thy`.

These sigma-algebra share a lot of natural properties (measurability of coordinates, for instance), but there is a fundamental difference: open sets are generated by arbitrary unions, not only countable ones, so typically many open sets will not be measurable with respect to the product sigma algebra (while all sets in the product sigma algebra are borel). The two sigma algebras coincide only when everything is countable (i.e., the product is countable, and the borel sigma algebra in the factor is countably generated).

In this paragraph, we develop basic measurability properties for the borel sigma algebra, and compare it with the product sigma algebra as explained above.

lemma *measurable_product_coordinates* [*measurable* (*raw*)]:
$(\lambda x.\ x\ i) \in measurable\ borel\ borel$
by (*rule borel_measurable_continuous_onI*[*OF continuous_on_product_coordinates*])

lemma *measurable_product_then_coordinatewise*:
fixes $f :: 'a \Rightarrow 'b \Rightarrow ('c :: topological\_space)$
assumes [*measurable*]: $f \in borel\_measurable\ M$
shows $(\lambda x.\ f\ x\ i) \in borel\_measurable\ M$
proof −
have $(\lambda x.\ f\ x\ i) = (\lambda y.\ y\ i)\ o\ f$
unfolding *comp_def* **by** *auto*
then show *?thesis* **by** *simp*
qed

To compare the Borel sigma algebra with the product sigma algebra, we give a presentation of the product sigma algebra that is more similar to the one we used above for the product topology.

No formalisation of Liouville's Approximation Theorem because this is already in the AFP as Liouville_Numbers. Apostol's Theorem 7.5 should be exactly the theorem liouville_irrational_algebraic. There is a minor discrepancy in the definition of "Liouville number" between Apostol and Eberl: he requires the denominator to be positive, while Eberl require it to exceed 1.

10.5 Scheffé's lemma

The next lemma shows that L^1 convergence of a sequence of functions follows from almost everywhere convergence and the weaker condition of the convergence of the integrated norms (or even just the nontrivial inequality about them). Useful in a lot of contexts! This statement (or its variations) are known as Scheffe lemma.

The formalization is more painful as one should jump back and forth between reals and ereals and justify all the time positivity or integrability (thankfully, measurability is handled more or less automatically).

proposition *Scheffe_lemma1*:
assumes $\bigwedge n.$ *integrable M (F n) integrable M f*
AE x in M. $(\lambda n.\ F\ n\ x) \longrightarrow f\ x$
limsup $(\lambda n.\ \int^+ x.\ norm(F\ n\ x)\ \partial M) \leq (\int^+ x.\ norm(f\ x)\ \partial M)$
shows $(\lambda n.\ \int^+ x.\ norm(F\ n\ x - f\ x)\ \partial M) \longrightarrow 0$

10.7.4 Averaging Theorem

We aim to lift results from the real case to arbitrary Banach spaces. Our fundamental tool in this regard will be the averaging theorem. The proof of this theorem is due to Serge Lang (Real and Functional Analysis) [5]. The theorem allows us to make statements about a function's value almost everywhere, depending on the value its integral takes on various sets of the measure space.

Before we introduce and prove the averaging theorem, we will first show the following lemma which is crucial for our proof. While not stated exactly in this manner, our proof makes use of the characterization of second-countable topological spaces given in the book General Topology by Ryszard Engelking (Theorem 4.1.15) [4]. (Engelking's book *General Topology*)

context *sigma_finite_measure*
begin

To show statements concerning σ-finite measure spaces, one usually shows the statement for finite measure spaces and uses a limiting argument to show it for the σ-finite case. The following induction scheme formalizes this.

lemma *sigma_finite_measure_induct*[*case_names finite_measure*, *consumes 0*]:
assumes $\bigwedge(N :: 'a\ measure)\ \Omega.\ finite\_measure\ N \Longrightarrow N = restrict\_space\ M\ \Omega \Longrightarrow \Omega \in sets\ M \Longrightarrow emeasure\ N\ \Omega \neq \infty \Longrightarrow emeasure\ N\ \Omega \neq 0 \Longrightarrow almost\_everywhere\ N\ Q$
and [*measurable*]: *Measurable.pred M Q*
shows *almost_everywhere M Q*
