

Isabelle/HOL — Higher-Order Logic

December 17, 2025

Contents

1	Loading the code generator and related modules	33
2	The basis of Higher-Order Logic	34
2.1	Primitive logic	35
2.1.1	Core syntax	36
2.1.2	Defined connectives and quantifiers	36
2.1.3	Additional concrete syntax	37
2.1.4	Axioms and basic definitions	39
2.2	Fundamental rules	40
2.2.1	Equality	40
2.2.2	Congruence rules for application	40
2.2.3	Equality of booleans – iff	41
2.2.4	True (1)	41
2.2.5	Universal quantifier (1)	41
2.2.6	False	42
2.2.7	Negation	42
2.2.8	Implication	42
2.2.9	Disjunction (1)	43
2.2.10	Derivation of <i>iffI</i>	43
2.2.11	True (2)	44
2.2.12	Universal quantifier (2)	44
2.2.13	Existential quantifier	44
2.2.14	Conjunction	44
2.2.15	Disjunction (2)	45
2.2.16	Classical logic	45
2.2.17	Unique existence	46
2.2.18	Classical intro rules for disjunction and existential quantifiers	46
2.2.19	Intuitionistic Reasoning	47
2.2.20	Atomizing meta-level connectives	48
2.2.21	Atomizing elimination rules	50

2.3	Package setup	50
2.3.1	Sledgehammer setup	50
2.3.2	Classical Reasoner setup	50
2.3.3	THE: definite description operator	53
2.3.4	Simplifier	53
2.3.5	Generic cases and induction	64
2.3.6	Coherent logic	68
2.3.7	Reorienting equalities	68
2.4	Other simple lemmas and lemma duplicates	69
2.5	Basic ML bindings	70
3	<i>NO-MATCH</i> simproc	72
3.1	Code generator setup	73
3.1.1	Generic code generator preprocessor setup	73
3.1.2	Generic code generator foundation	73
3.1.3	Equality	74
3.1.4	Generic code generator target languages	76
3.1.5	Evaluation and normalization by evaluation	77
3.2	Counterexample Search Units	77
3.2.1	Quickcheck	77
3.2.2	Nitpick setup	77
3.3	Preprocessing for the predicate compiler	78
3.4	Legacy tactics and ML bindings	78
4	Abstract orderings	78
4.1	Abstract ordering	79
4.2	Syntactic orders	82
4.3	Quasi orders	82
4.4	Partial orders	84
4.5	Linear (total) orders	87
4.6	Reasoning tools setup	88
4.7	Bounded quantifiers	92
4.8	Transitivity reasoning	95
4.9	min and max – fundamental	100
4.10	(Unique) top and bottom elements	101
4.11	Dense orders	103
4.12	Wellorders	105
4.13	Order on <i>bool</i>	106
4.14	Order on $- \Rightarrow -$	107
4.15	Order on unary and binary predicates	109
4.16	Name duplicates	110

5	Groups, also combined with orderings	111
5.1	Dynamic facts	111
5.2	Abstract structures	111
5.3	Generic operations	114
5.4	Semigroups and Monoids	115
5.5	Groups	119
5.6	(Partially) Ordered Groups	123
5.7	Support for reasoning about signs	125
5.8	Canonically ordered monoids	138
5.9	Tools setup	141
6	Abstract lattices	141
6.1	Abstract semilattice	141
6.2	Syntactic infimum and supremum operations	144
6.3	Concrete lattices	145
6.3.1	Intro and elim rules	145
6.3.2	Equational laws	146
6.3.3	Strict order	149
6.4	Distributive lattices	150
6.5	Bounded lattices	150
6.6	\min/\max as special case of lattice	152
6.7	Uniqueness of inf and sup	153
6.8	Lattice on $- \Rightarrow -$	154
7	Boolean Algebras	155
7.1	Abstract boolean algebra	156
7.1.1	Complement	157
7.1.2	Conjunction	158
7.1.3	Disjunction	158
7.1.4	De Morgan's Laws	159
7.2	Symmetric Difference	159
7.3	Type classes	161
7.4	Lattice on <i>bool</i>	163
7.5	Lattice on unary and binary predicates	164
7.6	Simproc setup	165
8	Set theory for higher-order logic	167
8.1	Sets as predicates	167
8.2	Subsets and bounded quantifiers	170
8.3	Basic operations	177
8.3.1	Subsets	177
8.3.2	Equality	178
8.3.3	The empty set	178
8.3.4	The universal set – UNIV	179

8.3.5	The Powerset operator – <i>Pow</i>	180
8.3.6	Set complement	180
8.3.7	Binary intersection	181
8.3.8	Binary union	181
8.3.9	Set difference	182
8.3.10	Augmenting a set – <i>insert</i>	182
8.3.11	Singletons, using <i>insert</i>	183
8.3.12	Image of a set under a function	185
8.3.13	Some rules with <i>if</i>	188
8.4	Further operations and lemmas	188
8.4.1	The “proper subset” relation	188
8.4.2	Derived rules involving subsets.	189
8.4.3	Equalities involving union, intersection, inclusion, etc.	190
8.4.4	Monotonicity of various operations	200
8.4.5	Inverse image of a function	201
8.4.6	Singleton sets	203
8.4.7	Getting the contents of a singleton set	204
8.4.8	Monad operation	204
8.4.9	Operations for execution	205
9	HOL type definitions	208
10	Notions about functions	210
10.1	The Identity Function <i>id</i>	210
10.2	The Composition Operator $f \circ g$	211
10.3	The Forward Composition Operator <i>fcomp</i>	212
10.4	Mapping functions	212
10.5	Injectivity and Bijectivity	213
10.5.1	Inj/surj/bij of Algebraic Operations	225
10.6	Function Updating	227
10.7	<i>override-on</i>	228
10.8	Inversion of injective functions	229
10.9	Monotonicity	230
10.9.1	Specializations For <i>ord</i> Type Class And More	231
10.9.2	Least value operator	239
10.10	Setup	239
10.10.1	Proof tools	239
10.10.2	Functorial structure of types	239
11	Complete lattices	240
11.1	Syntactic infimum and supremum operations	240
11.2	Abstract complete lattices	242
11.3	Complete lattice on <i>bool</i>	253
11.4	Complete lattice on $- \Rightarrow -$	253

11.5	Complete lattice on unary and binary predicates	254
11.6	Complete lattice on - <i>set</i>	256
11.6.1	Inter	256
11.6.2	Intersections of families	257
11.6.3	Union	259
11.6.4	Unions of families	261
11.6.5	Distributive laws	264
11.7	Injections and bijections	265
11.7.1	Complement	267
11.7.2	Miniscoping and maxiscoping	267
12	Wrapping Existing Freely Generated Type's Constructors	268
13	Knaster-Tarski Fixpoint Theorem and inductive definitions	269
13.1	Least fixed points	270
13.2	General induction rules for least fixed points	271
13.3	Greatest fixed points	272
13.4	Coinduction rules for greatest fixed points	273
13.5	Even Stronger Coinduction Rule, by Martin Coen	275
13.6	Rules for fixed point calculus	276
13.7	Inductive predicates and sets	277
13.8	The Schroeder-Bernstein Theorem	278
13.9	Inductive datatypes and primitive recursion	280
14	Cartesian products	280
14.1	<i>bool</i> is a datatype	280
14.2	The <i>unit</i> type	281
14.3	The product type	284
14.3.1	Type definition	284
14.3.2	Tuple syntax	285
14.3.3	Code generator setup	288
14.3.4	Fundamental operations and properties	288
14.3.5	Derived operations	295
14.4	Code generator setup for paired and tripled bounded set comprehension	306
14.5	Simproc for rewriting a set comprehension into a pointfree expression	307
14.6	Lemmas about disjointness	307
14.7	Inductively defined sets	307
14.8	Legacy theorem bindings and duplicates	308

15 The Disjoint Sum of Two Types	308
15.1 Construction of the sum type and its basic abstract operations	308
15.2 Projections	311
15.3 The Disjoint Sum of Sets	312
16 Rings	313
16.1 Semirings and rings	313
16.2 Abstract divisibility	316
16.3 Towards integral domains	322
16.4 (Partial) Division	327
16.5 Quotient and remainder in integral domains	350
16.6 Interlude: basic tool support for algebraic and arithmetic calculations	351
16.7 Ordered semirings and rings	352
16.8 Dioids	372
17 Natural numbers	373
17.1 Type <i>ind</i>	373
17.2 Type <i>nat</i>	373
17.3 Arithmetic operators	377
17.3.1 Addition	379
17.3.2 Difference	379
17.3.3 Multiplication	379
17.4 Orders on <i>nat</i>	380
17.4.1 Operation definition	380
17.4.2 Introduction properties	383
17.4.3 Elimination properties	383
17.4.4 Inductive (?) properties	384
17.4.5 Monotonicity of Addition	388
17.4.6 <i>min</i> and <i>max</i>	390
17.4.7 Additional theorems about (\leq)	391
17.4.8 More results about difference	397
17.4.9 Monotonicity of multiplication	399
17.5 Natural operation of natural numbers on functions	402
17.6 Kleene iteration	405
17.7 Embedding of the naturals into any <i>semiring-1: of-nat</i>	406
17.8 The set of natural numbers	410
17.9 Further arithmetic facts concerning the natural numbers	412
17.9.1 Greatest operator	420
17.10 Monotonicity of <i>funpow</i>	421
17.11 Kleene's fixed point theorem for continuous functions	421
17.12 The divides relation on <i>nat</i>	423
17.13 Aliases	425
17.14 Size of a datatype value	426

17.15	Code module namespace	427
18	Fields	427
18.1	Division rings	427
18.2	Fields	433
18.3	Ordered fields	438
19	Relations – as sets of pairs, and binary predicates	454
19.1	Fundamental	455
19.1.1	Relations as sets of pairs	455
19.1.2	Conversions between set and predicate relations	455
19.2	Properties of relations	457
19.2.1	Reflexivity	457
19.2.2	Irreflexivity	460
19.2.3	Asymmetry	461
19.2.4	Symmetry	463
19.2.5	Antisymmetry	465
19.2.6	Transitivity	468
19.2.7	Totality	472
19.2.8	Left uniqueness	474
19.2.9	Right uniqueness	475
19.3	Relation operations	476
19.3.1	The identity relation	476
19.3.2	Diagonal: identity over a set	477
19.3.3	Composition	478
19.3.4	Converse	480
19.3.5	Domain, range and field	483
19.3.6	Image of a set under a relation	486
19.3.7	Inverse image	488
19.3.8	Powerset	489
20	Finite sets	489
20.1	Predicate for finite sets	489
20.1.1	Choice principles	490
20.1.2	Finite sets are the images of initial segments of natural numbers	491
20.2	Finiteness and common set operations	492
20.3	Further induction rules on finite sets	501
20.4	Class <i>finite</i>	504
20.5	A basic fold functional for finite sets	505
20.5.1	From <i>fold-graph</i> to <i>fold</i>	506
20.5.2	Liftings to <i>comp-fun-commute-on</i> etc.	513
20.5.3	<i>UNIV</i> as carrier set	514
20.5.4	Expressing set operations via <i>fold</i>	515

20.5.5	Expressing relation operations via <i>fold</i>	520
20.6	Locales as mini-packages for fold operations	522
20.6.1	The natural case	522
20.6.2	With idempotency	523
20.6.3	<i>UNIV</i> as the carrier set	523
20.7	Finite cardinality	524
20.7.1	Cardinality of image	537
20.7.2	Pigeonhole Principles	538
20.7.3	Cardinality of sums	539
20.8	Minimal and maximal elements of finite sets	540
20.8.1	Finite orders	546
20.8.2	Relating injectivity and surjectivity	547
20.9	Infinite Sets	549
20.10	The finite powerset operator	551
21	Reflexive and Transitive closure of a relation	552
21.1	Reflexive closure	554
21.2	Reflexive-transitive closure	555
21.3	Transitive closure	560
21.4	Symmetric closure	570
21.5	The power operation on relations	571
21.6	Bounded transitive closure	581
21.7	Acyclic relations	583
21.8	Setup of transitivity reasoner	583
22	Well-founded Recursion	585
22.1	Basic Definitions	585
22.2	Equivalence of Definitions	586
22.3	Induction Principles	586
22.4	Introduction Rules	587
22.5	Ordering Properties	588
22.6	Basic Results	589
22.6.1	Minimal-element characterization of well-foundedness	590
22.6.2	Finite characterization of well-foundedness	591
22.6.3	Antimonotonicity	592
22.6.4	Equivalence between <i>wfp-on</i> and <i>wfp</i>	593
22.6.5	Well-foundedness of transitive closure	593
22.6.6	Well-foundedness of image	597
22.7	Well-Foundedness Results for Unions	599
22.8	Well-Foundedness of Composition	602
22.9	Acyclic relations	603
22.9.1	Wellfoundedness of finite acyclic relations	603
22.10	<i>nat</i> is well-founded	604
22.11	Accessible Part	605

22.12	Tools for building wellfounded relations	608
22.12.1	Conversion to a known well-founded relation	608
22.12.2	Measure functions into <i>nat</i>	609
22.12.3	Lexicographic combinations	610
22.12.4	Bounded increase must terminate	615
22.13	Code Generation Setup	615
23	Well-Founded Recursion Combinator	615
23.0.1	Well-founded recursion via genuine fixpoints	617
23.1	Wellfoundedness of <i>samefst</i>	617
24	Orders as Relations	618
24.1	Orders on a set	618
24.2	Orders on the field	619
24.3	Relations given by a predicate and the field	621
24.4	Orders on a type	623
24.5	Order-like relations	623
24.5.1	Auxiliaries	623
24.5.2	The upper and lower bounds operators	624
24.6	Variations on Well-Founded Relations	627
24.6.1	Characterizations of well-foundedness	627
24.6.2	Characterizations of well-foundedness	630
25	Hilbert's Epsilon-Operator and the Axiom of Choice	631
25.1	Hilbert's epsilon	631
25.2	Hilbert's Epsilon-operator	632
25.3	Axiom of Choice, Proved Using the Description Operator	633
25.4	Getting an element of a nonempty set	634
25.5	Function Inverse	635
25.6	Other Consequences of Hilbert's Epsilon	645
25.7	An aside: bounded accessible part	647
25.8	More on injections, bijections, and inverses	649
25.9	Specification package – Hilbertized version	651
25.10	Complete Distributive Lattices – Properties depending on Hilbert Choice	651
26	Zorn's Lemma and the Well-ordering Theorem	658
26.1	Zorn's Lemma for the Subset Relation	658
26.1.1	Results that do not require an order	658
26.1.2	Hausdorff's Maximum Principle	663
26.1.3	Results for the proper subset relation	664
26.1.4	Zorn's lemma	665
26.2	Zorn's Lemma for Partial Orders	666
26.3	Other variants of Zorn's Lemma	667

26.4	The Well Ordering Theorem	670
27	Well-Order Relations as Needed by Bounded Natural Functors	676
27.1	Auxiliaries	676
27.2	Well-founded induction and recursion adapted to non-strict well-order relations	677
27.3	The notions of maximum, minimum, supremum, successor and order filter	678
27.3.1	Properties of max2	679
27.3.2	Existence and uniqueness for isMinim and well-definedness of minim	680
27.3.3	Properties of minim	681
27.3.4	Properties of successor	681
27.3.5	Properties of order filters	683
27.3.6	Other properties	685
28	Well-Order Embeddings as Needed by Bounded Natural Functors	687
28.1	Auxiliaries	687
28.2	(Well-order) embeddings, strict embeddings, isomorphisms and order-compatible functions	688
28.3	Given any two well-orders, one can be embedded in the other	696
28.4	Uniqueness of embeddings	703
28.5	More properties of embeddings, strict embeddings and isomorphisms	705
29	Constructions on Wellorders as Needed by Bounded Natural Functors	711
29.1	Restriction to a set	711
29.2	Order filters versus restrictions and embeddings	713
29.3	The strict inclusion on proper ofilters is well-founded	717
29.4	Ordering the well-orders by existence of embeddings	717
29.5	$< o$ is well-founded	727
29.6	Copy via direct images	728
29.7	Bounded square	732
30	Cardinal-Order Relations as Needed by Bounded Natural Functors	745
30.1	Cardinal orders	745
30.2	Cardinal of a set	747
30.3	Cardinals versus set operations on arbitrary sets	752
30.4	Cardinals versus set operations involving infinite sets	760
30.5	The cardinal ω and the finite cardinals	767

30.5.1	First as well-orders	767
30.5.2	Then as cardinals	768
30.6	The successor of a cardinal	769
30.7	Regular cardinals	776
30.8	Others	778
30.9	Regular vs. stable cardinals	780
31	Cardinal Arithmetic as Needed by Bounded Natural Func-	
	tors	785
31.1	Zero	785
31.2	(In)finite cardinals	786
31.3	Binary sum	787
31.4	One	789
31.5	Two	790
31.6	Family sum	790
31.7	Product	790
31.8	Exponentiation	794
32	Function Definition Base	802
33	Definition of Bounded Natural Functors	802
34	Composition of Bounded Natural Functors	808
35	Registration of Basic Types as Bounded Natural Functors	813
36	Shared Fixpoint Operations on Bounded Natural Functors	819
37	Least Fixpoint (Datatype) Operation on Bounded Natural	
	Functors	825
38	Equivalence Relations in Higher-Order Set Theory	829
38.1	Equivalence relations – set version	829
38.2	Equivalence classes	831
38.3	Quotients	832
38.4	Refinement of one equivalence relation WRT another	833
38.5	Defining unary operations upon equivalence classes	834
38.6	Defining binary operations upon equivalence classes	835
38.7	Quotients and finiteness	837
38.8	Kernel of a Function	838
38.9	Projection	838
38.10	Equivalence relations – predicate version	839
38.11	Equivalence closure	841

39 MESON Proof Method	845
39.1 Negation Normal Form	845
39.2 Pulling out the existential quantifiers	846
39.3 Lemmas for Forward Proof	847
39.4 Clausification helper	847
39.5 Skolemization helpers	849
39.6 Meson package	849
40 Automatic Theorem Provers (ATPs)	849
40.1 ATP problems and proofs	849
40.2 Higher-order reasoning helpers	849
40.3 Basic connection between ATPs and HOL	852
41 Metis Proof Method	852
41.1 Literal selection and lambda-lifting helpers	852
41.2 Metis package	853
42 Generic theorem transfer using relations	853
42.1 Relator for function space	853
42.2 Transfer method	854
42.3 Predicates on relations, i.e. “class constraints”	855
42.4 Properties of relators	859
42.5 Transfer rules	861
42.6 <i>of-bool</i> and <i>of-nat</i>	866
43 Lifting package	867
43.1 Function map	867
43.2 Quotient Predicate	867
43.3 Quotient composition	871
43.4 Respects predicate	871
43.5 Domains	877
43.6 ML setup	878
44 Definition of Quotient Types	879
44.1 Quotient Predicate	879
44.2 lemmas for regularisation of ball and bex	883
44.3 Bounded abstraction	885
44.4 <i>Bex1-rel</i> quantifier	887
44.5 Various respects and preserve lemmas	887
44.6 Quotient composition	890
44.7 Quotient3 to Quotient	891
44.8 ML setup	892
44.9 Methods / Interface	893
45 Lifting of BNFs	894

46 Binary Numerals	897
46.1 The <i>num</i> type	897
46.2 Numeral operations	899
46.3 Binary numerals	902
46.4 Class-specific numeral rules	904
46.4.1 Structures with addition: class <i>numeral</i>	904
46.4.2 Structures with negation: class <i>neg-numeral</i>	904
46.4.3 Structures with multiplication: class <i>semiring-numeral</i>	908
46.4.4 Structures with a zero: class <i>semiring-1</i>	908
46.4.5 Equality: class <i>semiring-char-0</i>	909
46.4.6 Comparisons: class <i>linordered-nonzero-semiring</i>	910
46.4.7 Multiplication and negation: class <i>ring-1</i>	912
46.4.8 Equality using <i>iszero</i> for rings with non-zero characteristic	913
46.4.9 Equality and negation: class <i>ring-char-0</i>	914
46.4.10 Structures with negation and order: class <i>linordered-idom</i>	915
46.4.11 Natural numbers	918
46.5 Particular lemmas concerning $\mathbb{Z}::'a$	922
46.6 Numeral equations as default simplification rules	922
46.6.1 Special Simplification for Constants	922
46.6.2 Optional Simplification Rules Involving Constants	924
46.7 Setting up simprocs	925
46.7.1 Simplification of arithmetic operations on integer constants	926
46.7.2 Simplification of arithmetic when nested to the right	927
46.8 Code module namespace	928
46.9 Printing of evaluated natural numbers as numerals	928
46.10 More on auxiliary conversion	928
47 Exponentiation	928
47.1 Powers for Arbitrary Monoids	928
47.2 Exponentiation on ordered types	937
47.3 Miscellaneous rules	946
47.4 Exponentiation for the Natural Numbers	948
47.4.1 Cardinality of the Powerset	950
47.5 Code generator tweak	950
48 Big sum and product over finite (non-empty) sets	951
48.1 Generic monoid operation over a set	951
48.1.1 Standard sum or product indexed by a finite set	951
48.1.2 HOL Light variant: sum/product indexed by the non-neutral subset	962
48.2 Generalized summation over a set	964
48.2.1 Properties in more restricted classes of structures	965

48.2.2	Cardinality as special case of <i>sum</i>	973
48.2.3	Cardinality of products	979

2.1 Primitive logic

The definition of the logic is based on Mike Gordon’s technical report [2] that describes the first implementation of HOL. However, there are a number of differences. In particular, we start with the definite description operator and introduce Hilbert’s ε operator only much later. Moreover, axiom $(P \longrightarrow Q) \longrightarrow (Q \longrightarrow P) \longrightarrow (P = Q)$ is derived from the other axioms. The fact that this axiom is derivable was first noticed by Bruno Barras (for Mike Gordon’s line of HOL systems) and later independently by Alexander

Maletzký (for Isabelle/HOL).

2.1.1 Core syntax

```

setup  $\langle \text{Aclass.class-axiomatization } (\textbf{binding} \langle \text{type} \rangle, []) \rangle$ 
default-sort type
setup  $\langle \text{Object-Logic.add-base-sort } \textbf{sort} \langle \text{type} \rangle \rangle$ 

setup  $\langle \text{Proofterm.set-preproc } (\text{Proof-Rewrite-Rules.standard-preproc } []) \rangle$ 

axiomatization where fun-arity:  $\text{OFCLASS}('a \Rightarrow 'b, \text{type-class})$ 
instance fun ::  $(\text{type}, \text{type}) \text{ type}$  by  $(\text{rule fun-arity})$ 

axiomatization where itself-arity:  $\text{OFCLASS}('a \text{ itself}, \text{type-class})$ 
instance itself ::  $(\text{type}) \text{ type}$  by  $(\text{rule itself-arity})$ 

typedecl bool

judgment Trueprop ::  $\text{bool} \Rightarrow \text{prop}$   $(\langle \langle \text{notation=judgment} \rangle - \rangle 5)$ 

axiomatization implies ::  $[\text{bool}, \text{bool}] \Rightarrow \text{bool}$  (infixr  $\langle \longrightarrow \rangle 25$ )
  and eq ::  $['a, 'a] \Rightarrow \text{bool}$ 
  and The ::  $('a \Rightarrow \text{bool}) \Rightarrow 'a$ 

notation (input)
  eq (infixl  $\langle \Rightarrow \rangle 50$ )
notation (output)
  eq (infix  $\langle \Rightarrow \rangle 50$ )

```

The input syntax for *eq* is more permissive than the output syntax because of the large amount of material that relies on **infixl**.

2.1.2 Defined connectives and quantifiers

```

definition True :: bool
  where True  $\equiv ((\lambda x::\text{bool}. x) = (\lambda x. x))$ 

definition All ::  $('a \Rightarrow \text{bool}) \Rightarrow \text{bool}$  (binder  $\langle \forall \rangle 10$ )
  where All P  $\equiv (P = (\lambda x. \text{True}))$ 

definition Ex ::  $('a \Rightarrow \text{bool}) \Rightarrow \text{bool}$  (binder  $\langle \exists \rangle 10$ )
  where Ex P  $\equiv \forall Q. (\forall x. P\ x \longrightarrow Q) \longrightarrow Q$ 

definition False :: bool
  where False  $\equiv (\forall P. P)$ 

definition Not ::  $\text{bool} \Rightarrow \text{bool}$   $(\langle \langle \text{open-block notation=prefix } \neg \rangle \neg \rangle [40] 40)$ 
  where not-def:  $\neg P \equiv P \longrightarrow \text{False}$ 

```

definition *conj* :: [bool, bool] \Rightarrow bool (**infixr** $\langle \wedge \rangle$ 35)
 where *and-def*: $P \wedge Q \equiv \forall R. (P \longrightarrow Q \longrightarrow R) \longrightarrow R$

definition *disj* :: [bool, bool] \Rightarrow bool (**infixr** $\langle \vee \rangle$ 30)
 where *or-def*: $P \vee Q \equiv \forall R. (P \longrightarrow R) \longrightarrow (Q \longrightarrow R) \longrightarrow R$

definition *Uniq* :: ('a \Rightarrow bool) \Rightarrow bool
 where *Uniq* $P \equiv (\forall x y. P x \longrightarrow P y \longrightarrow y = x)$

definition *Ex1* :: ('a \Rightarrow bool) \Rightarrow bool
 where *Ex1* $P \equiv \exists x. P x \wedge (\forall y. P y \longrightarrow y = x)$

2.1.3 Additional concrete syntax

syntax (*ASCII*) *-Uniq* :: *pttrn* \Rightarrow bool \Rightarrow bool ($\langle \langle \text{indent}=4 \text{ notation}=\langle \text{binder} \text{ ?<> ?< -./ -} \rangle [0, 10] 10 \rangle$

2.2 Fundamental rules

2.2.1 Equality

lemma *sym*: $s = t \implies t = s$
by (*erule subst*) (*rule refl*)

lemma *ssubst*: $t = s \implies P\ s \implies P\ t$
by (*drule sym*) (*erule subst*)

lemma *trans*: $\llbracket r = s; s = t \rrbracket \implies r = t$
by (*erule subst*)

lemma *trans-sym* [*Pure.elim?*]: $r = s \implies t = s \implies r = t$
by (*rule trans* [*OF - sym*])

lemma *meta-eq-to-obj-eq*:
assumes $A \equiv B$
shows $A = B$
unfolding *assms* **by** (*rule refl*)

Useful with *erule* for proving equalities from known equalities.

lemma *box-equals*: $\llbracket a = b; a = c; b = d \rrbracket \implies c = d$
by (*iprover intro: sym trans*)

For calculational reasoning:

lemma *forw-subst*: $a = b \implies P\ b \implies P\ a$
by (*rule ssubst*)

lemma *back-subst*: $P\ a \implies a = b \implies P\ b$
by (*rule subst*)

2.2.2 Congruence rules for application

Similar to *AP-THM* in Gordon’s HOL.

lemma *fun-cong*: $(f :: 'a \Rightarrow 'b) = g \implies f\ x = g\ x$
by (*iprover intro: refl elim: subst*)

Similar to *AP-TERM* in Gordon’s HOL and FOL’s *subst-context*.

lemma *arg-cong*: $x = y \implies f\ x = f\ y$
by (*iprover intro: refl elim: subst*)

lemma *arg-cong2*: $\llbracket a = b; c = d \rrbracket \Longrightarrow f\ a\ c = f\ b\ d$
by (*iprover intro: refl elim: subst*)

lemma *arg-cong3*: $\llbracket x = x'; y = y'; z = z' \rrbracket \Longrightarrow f\ x\ y\ z = f\ x'\ y'\ z'$
by (*iprover intro: refl elim: subst*)

lemma *arg-cong4*: $\llbracket w = w'; x = x'; y = y'; z = z' \rrbracket \Longrightarrow f\ w\ x\ y\ z = f\ w'\ x'\ y'\ z'$
by (*iprover intro: refl elim: subst*)

lemma *cong*: $\llbracket f = g; (x::'a) = y \rrbracket \Longrightarrow f\ x = g\ y$
by (*iprover intro: refl elim: subst*)

ML $\langle \text{fun cong-tac ctxt} = \text{Cong-Tac.cong-tac ctxt} @ \{\text{thm cong}\} \rangle$

2.2.3 Equality of booleans – iff

lemma *iffD2*: $\llbracket P = Q; Q \rrbracket \Longrightarrow P$
by (*erule ssubst*)

lemma *rev-iffD2*: $\llbracket Q; P = Q \rrbracket \Longrightarrow P$
by (*erule iffD2*)

lemma *iffD1*: $Q = P \Longrightarrow Q \Longrightarrow P$
by (*drule sym*) (*rule iffD2*)

lemma *rev-iffD1*: $Q \Longrightarrow Q = P \Longrightarrow P$
by (*drule sym*) (*rule rev-iffD2*)

lemma *iffE*:
assumes *major*: $P = Q$
and *minor*: $\llbracket P \longrightarrow Q; Q \longrightarrow P \rrbracket \Longrightarrow R$
shows R
by (*iprover intro: minor impI major [THEN iffD2] major [THEN iffD1]*)

2.2.4 True (1)

lemma *TrueI*: *True*
unfolding *True-def* **by** (*rule refl*)

lemma *eqTrueE*: $P = \text{True} \Longrightarrow P$
by (*erule iffD2*) (*rule TrueI*)

2.2.5 Universal quantifier (1)

lemma *spec*: $\forall x::'a. P\ x \Longrightarrow P\ x$
unfolding *All-def* **by** (*iprover intro: eqTrueE fun-cong*)

lemma *allE*:
assumes *major*: $\forall x. P\ x$ **and** *minor*: $P\ x \Longrightarrow R$

shows R
by (*iprover intro: minor major [THEN spec]*)

lemma *all-dupE*:
assumes *major*: $\forall x. P\ x$ **and** *minor*: $\llbracket P\ x; \forall x. P\ x \rrbracket \implies R$
shows R
by (*iprover intro: minor major major [THEN spec]*)

2.2.6 False

Depends upon *spec*; it is impossible to do propositional logic before quantifiers!

lemma *FalseE*: $\text{False} \implies P$
unfolding *False-def* **by** (*erule spec*)

lemma *False-neq-True*: $\text{False} = \text{True} \implies P$
by (*erule eqTrueE [THEN FalseE]*)

2.2.7 Negation

lemma *notI*:
assumes $P \implies \text{False}$
shows $\neg P$
unfolding *not-def* **by** (*iprover intro: impI assms*)

lemma *False-not-True*: $\text{False} \neq \text{True}$
by (*iprover intro: notI elim: False-neq-True*)

lemma *True-not-False*: $\text{True} \neq \text{False}$
by (*iprover intro: notI dest: sym elim: False-neq-True*)

lemma *notE*: $\llbracket \neg P; P \rrbracket \implies R$
unfolding *not-def*
by (*iprover intro: mp [THEN FalseE]*)

2.2.8 Implication

lemma *impE*:
assumes $P \longrightarrow Q$ P $Q \implies R$
shows R
by (*iprover intro: assms mp*)

Reduces Q to $P \longrightarrow Q$, allowing substitution in P .

lemma *rev-mp*: $\llbracket P; P \longrightarrow Q \rrbracket \implies Q$
by (*rule mp*)

lemma *contrapos-nn*:
assumes *major*: $\neg Q$
and *minor*: $P \implies Q$

shows $\neg P$
by (*iprover intro: notI minor major [THEN notE]*)

Not used at all, but we already have the other 3 combinations.

lemma *contrapos-pn*:
assumes *major*: Q
and *minor*: $P \implies \neg Q$
shows $\neg P$
by (*iprover intro: notI minor major notE*)

lemma *not-sym*: $t \neq s \implies s \neq t$
by (*erule contrapos-nn*) (*erule sym*)

lemma *eq-neq-eq-imp-neq*: $\llbracket x = a; a \neq b; b = y \rrbracket \implies x \neq y$
by (*erule subst, erule ssubst, assumption*)

2.2.9 Disjunction (1)

lemma *disjE*:
assumes *major*: $P \vee Q$
and *minorP*: $P \implies R$
and *minorQ*: $Q \implies R$
shows R
by (*iprover intro: minorP minorQ impI*
major [unfolded or-def, THEN spec, THEN mp, THEN mp])

2.2.10 Derivation of *iffI*

In an intuitionistic version of HOL *iffI* needs to be an axiom.

lemma *iffI*:
assumes $P \implies Q$ **and** $Q \implies P$
shows $P = Q$
proof (*rule disjE[OF True-or-False[of P]]*)
assume $1: P = \text{True}$
note $Q = \text{assms}(1)[\text{OF } \text{eqTrueE}[\text{OF this}]]$
from 1 **show** *?thesis*
proof (*rule ssubst*)
from *True-or-False[of Q]* **show** $\text{True} = Q$
proof (*rule disjE*)
assume $Q = \text{True}$
thus *?thesis* **by** (*rule sym*)
next
assume $Q = \text{False}$
with Q **have** False **by** (*rule rev-iffD1*)
thus *?thesis* **by** (*rule FalseE*)
qed
qed
next
assume $2: P = \text{False}$

```

2.2.18 Classical intro rules for disjunction and existential quantifiers

lemma disjCI:

assumes $\neg Q \implies P$

shows $P \vee Q$

by (rule classical) (iprover intro: assms disjI1 disjI2 notI elim: notE)

lemma *excluded-middle*: $\neg P \vee P$
by (*iprover intro: disjCI*)

case distinction as a natural deduction rule. Note that $\neg P$ is the second case, not the first.

lemma *case-split* [*case-names True False*]:
assumes $P \implies Q \neg P \implies Q$
shows Q
using *excluded-middle* [*of P*]
by (*iprover intro: assms elim: disjE*)

Classical implies (\longrightarrow) elimination.

lemma *impCE*:
assumes *major*: $P \longrightarrow Q$
and *minor*: $\neg P \implies R \ Q \implies R$
shows R
using *excluded-middle* [*of P*]
by (*iprover intro: minor major [THEN mp] elim: disjE*)⁺

This version of \longrightarrow elimination works on Q before P . It works best for those cases in which P holds "almost everywhere". Can't install as default: would break old proofs.

lemma *impCE'*:
assumes *major*: $P \longrightarrow Q$
and *minor*: $Q \implies R \neg P \implies R$
shows R
using *assms* **by** (*elim impCE*)

The analogous introduction rule for conjunction, above, is even constructive

lemma *context-disjE*:
assumes *major*: $P \vee Q$ **and** *minor*: $P \implies R \neg P \implies Q \implies R$
shows R
by (*iprover intro: disjE [OF major] disjE [OF excluded-middle] assms*)

Classical \longleftrightarrow elimination.

lemma *iffCE*:
assumes *major*: $P = Q$
and *minor*: $\llbracket P; Q \rrbracket \implies R \llbracket \neg P; \neg Q \rrbracket \implies R$
shows R
by (*rule major [THEN iffE]*) (*iprover intro: minor elim: impCE notE*)

lemmas [*cong*] = *imp-cong simp-implies-cong*

lemmas [*split*] = *if-split*

ML $\langle \text{val } \textit{HOL-ss} = \textit{simpset-of } \textbf{context} \rangle$

Simplifies x assuming c and y assuming $\neg c$.

lemma *if-cong*:

assumes $b = c$
and $c \implies x = u$
and $\neg c \implies y = v$
shows $(\text{if } b \text{ then } x \text{ else } y) = (\text{if } c \text{ then } u \text{ else } v)$
using *assms* **by** *simp*

Prevents simplification of x and y : faster and allows the execution of functional programs.

lemma *if-weak-cong* [*cong*]:

assumes $b = c$
shows $(\text{if } b \text{ then } x \text{ else } y) = (\text{if } c \text{ then } x \text{ else } y)$
using *assms* **by** (*rule arg-cong*)

Prevents simplification of t : much faster

lemma *let-weak-cong*:

assumes $a = b$
shows $(\text{let } x = a \text{ in } t \ x) = (\text{let } x = b \text{ in } t \ x)$
using *assms* **by** (*rule arg-cong*)

To tidy up the result of a *simproc*. Only the RHS will be simplified.

lemma *eq-cong2*:

assumes $u = u'$

shows $(t \equiv u) \equiv (t \equiv u')$

using *assms* **by** *simp*

lemma *if-distrib*: $f \text{ (if } c \text{ then } x \text{ else } y) = (\text{if } c \text{ then } f x \text{ else } f y)$

by *simp*

lemma *if-distribR*: $(\text{if } b \text{ then } f \text{ else } g) x = (\text{if } b \text{ then } f x \text{ else } g x)$

by *simp*

lemma *all-if-distrib*: $(\forall x. \text{if } x = a \text{ then } P x \text{ else } Q x) \longleftrightarrow P a \wedge (\forall x. x \neq a \longrightarrow Q x)$

by *auto*

lemma *ex-if-distrib*: $(\exists x. \text{if } x = a \text{ then } P x \text{ else } Q x) \longleftrightarrow P a \vee (\exists x. x \neq a \wedge Q x)$

by *auto*

lemma *if-if-eq-conj*: $(\text{if } P \text{ then if } Q \text{ then } x \text{ else } y \text{ else } y) = (\text{if } P \wedge Q \text{ then } x \text{ else } y)$

by *simp*

As a simplification rule, it replaces all function equalities by first-order equalities.

lemma *fun-eq-iff*: $f = g \longleftrightarrow (\forall x. f x = g x)$

by *auto*

3 NO-MATCH simproc

The simplification procedure can be used to avoid simplification of terms of a certain form.

definition *NO-MATCH* :: $'a \Rightarrow 'b \Rightarrow \text{bool}$

where *NO-MATCH* *pat val* $\equiv \text{True}$

lemma *NO-MATCH-cong[cong]*: *NO-MATCH* *pat val* = *NO-MATCH* *pat val*

by (*rule refl*)

declare $[[\text{coercion-args } \text{NO-MATCH} \text{ } - \text{ } -]]$

simproc-setup *NO-MATCH* (*NO-MATCH* *pat val*) = $\langle K\ (fn\ ctxt \Rightarrow fn\ ct \Rightarrow$

let

val thy = *Proof-Context.theory-of* *ctxt*

val dest-binop = *Term.dest-comb* $\#>$ *apfst* (*Term.dest-comb* $\#>$ *snd*)

val m = *Pattern.matches* *thy* (*dest-binop* (*Thm.term-of* *ct*))

in if m then NONE else SOME $@\{thm\ NO-MATCH-def\}$ *end*)

\rangle

This setup ensures that a rewrite rule of the form *NO-MATCH* *pat val* $\implies t$ is only applied, if the pattern *pat* does not match the value *val*.

Tagging a premise of a simp rule with ASSUMPTION forces the simplifier not to simplify the argument and to solve it by an assumption.

›

```
method-setup order = ⟨
  Scan.succeed (fn ctxt => SIMPLE-METHOD' (HOL-Order-Tac.tac [] ctxt))
⟩ partial and linear order reasoner
```

The method *order* allows one to use the order tactic located in `../Provers/order_tac.ML` in a standalone fashion.

The tactic rearranges the goal to prove *False*, then retrieves order literals of partial and linear orders (i.e. $x = y$, $x \leq y$, $x < y$, and their negated versions) from the premises and finally tries to derive a contradiction. Its main use case is as a solver to *simp* (see below), where it e.g. solves premises of conditional rewrite rules.

The tactic has two configuration attributes that control its behaviour:

- *order-trace* toggles tracing for the solver.
- *order-split-limit* limits the number of order literals of the form $\neg x < y$ that are passed to the tactic. This is helpful since these literals lead to case splitting and thus exponential runtime. This only applies to partial orders.

We setup the solver for HOL with the structure `HOL_Order_Tac` here but the prover is agnostic to the object logic. It is possible to register orders with the prover using the functions `HOL_Order_Tac.declare_order` and `HOL_Order_Tac.declare_linorder`, which we do below for the type classes *order* and *linorder*. If possible, one should instantiate these type classes instead of registering new orders with the solver. One can also interpret the type class locales *order* and *linorder*. An example can be seen in `Library/Sublist.thy`, which contains e.g. the prefix order on lists.

The diagnostic command **print-orders** shows all orders known to the tactic in the current context.

begin

```

5.1 Dynamic facts

```

named-theorems ac-simps associativity and commutativity simplification rules
  and algebra-simps algebra simplification rules for rings
  and algebra-split-simps algebra simplification rules for rings, with potential goal
splitting
  and field-simps algebra simplification rules for fields
  and field-split-simps algebra simplification rules for fields, with potential goal
splitting

```

The rewrites accumulated in *algebra-simps* deal with the classical algebraic structures of groups, rings and family. They simplify terms by multiplying everything out (in case of a ring) and bringing sums and products into a canonical form (by ordered rewriting). As a result it decides group and ring equalities but also helps with inequalities.

Of course it also works for fields, but it knows nothing about multiplicative inverses or division. This is catered for by *field-simps*.

Facts in *field-simps* multiply with denominators in (in)equations if they can be proved to be non-zero (for equations) or positive/negative (for inequalities). Can be too aggressive and is therefore separate from the more benign *algebra-simps*.

Collections *algebra-split-simps* and *field-split-simps* correspond to *algebra-simps* and *field-simps* but contain more aggressive rules that may lead to goal splitting.

5.2 Abstract structures

These locales provide basic structures for interpretation into bigger structures; extensions require careful thinking, otherwise undesired effects may occur due to interpretation.

5.6 (Partially) Ordered Groups

The theory of partially ordered groups is taken from the books:

- *Lattice Theory* by Garret Birkhoff, American Mathematical Society, 1979
- *Partially Ordered Algebraic Systems*, Pergamon Press, 1963

Most of the used notions can also be looked up in

- <http://www.mathworld.com> by Eric Weisstein et. al.
- *Algebra I* by van der Waerden, Springer

```

8.3.12 Image of a set under a function

Frequently b does not have the syntactic form of $f x$.

definition *image* :: $(\text{'a} \Rightarrow \text{'b}) \Rightarrow \text{'a set} \Rightarrow \text{'b set}$ (**infixr** $\langle \text{'} \rangle$ 90)
 where $f \text{' } A = \{y. \exists x \in A. y = f x\}$

lemma *image-eqI* [*simp*, *intro*]: $b = f x \Longrightarrow x \in A \Longrightarrow b \in f \text{' } A$
unfolding *image-def* **by** *blast*

lemma *imageI*: $x \in A \Longrightarrow f x \in f \text{' } A$
by (*rule image-eqI*) (*rule refl*)

lemma *rev-image-eqI*: $x \in A \Longrightarrow b = f x \Longrightarrow b \in f \text{' } A$
 — This version’s more effective when we already have the required x .
by (*rule image-eqI*)

lemma *imageE* [*elim!*]:
assumes $b \in (\lambda x. f x) \text{' } A$ — The eta-expansion gives variable-name preservation.
obtains x **where** $b = f x$ **and** $x \in A$
using *assms* **unfolding** *image-def* **by** *blast*

lemma *Compr-image-eq*: $\{x \in f \text{' } A. P x\} = f \text{' } \{x \in A. P (f x)\}$
by *auto*

lemma *image-Un*: $f \text{' } (A \cup B) = f \text{' } A \cup f \text{' } B$
by *blast*

lemma *image-iff*: $z \in f \text{' } A \longleftrightarrow (\exists x \in A. z = f x)$
by *blast*

lemma *image-subsetI*: $(\bigwedge x. x \in A \Longrightarrow f x \in B) \Longrightarrow f \text{' } A \subseteq B$
 — Replaces the three steps *subsetI*, *imageE*, *hypsubst*, but breaks too many existing proofs.
by *blast*

lemma *image-subset-iff*: $f \text{' } A \subseteq B \longleftrightarrow (\forall x \in A. f x \in B)$
 — This rewrite rule would confuse users if made default.
by *blast*

lemma *subset-imageE*:
assumes $B \subseteq f \text{' } A$
obtains C **where** $C \subseteq A$ **and** $B = f \text{' } C$
proof —
from *assms* **have** $B = f \text{' } \{a \in A. f a \in B\}$ **by** *fast*
moreover **have** $\{a \in A. f a \in B\} \subseteq A$ **by** *blast*
ultimately show *thesis* **by** (*blast intro: that*)
qed

lemma *subset-image-iff*: $B \subseteq f \text{ ‘ } A \longleftrightarrow (\exists A A \subseteq A. B = f \text{ ‘ } A A)$
by (*blast elim: subset-imageE*)

lemma *image-ident* [*simp*]: $(\lambda x. x) \text{ ‘ } Y = Y$
by *blast*

lemma *image-empty* [*simp*]: $f \text{ ‘ } \{\} = \{\}$
by *blast*

lemma *image-insert* [*simp*]: $f \text{ ‘ } \text{insert } a \ B = \text{insert } (f \ a) \ (f \text{ ‘ } B)$
by *blast*

lemma *image-constant*: $x \in A \implies (\lambda x. c) \text{ ‘ } A = \{c\}$

14.1 bool is a datatype

```
free-constructors (discs-sels) case-bool for True | False
by auto
```

Avoid name clashes by prefixing the output of *old-rep-datatype* with *old*.

```
setup <Sign.mandatory-path old>
```

```
old-rep-datatype True False by (auto intro: bool-induct)
```

```
setup  $\langle \text{Sign.parent-path} \rangle$ 
```

But erase the prefix for properties that are not generated by *free-constructors*.

```
setup  $\langle \text{Sign.mandatory-path bool} \rangle$ 
```

```
lemmas induct = old.bool.induct
```

```
lemmas inducts = old.bool.inducts
```

```
lemmas rec = old.bool.rec
```

```
lemmas simps = bool.distinct bool.case bool.rec
```

```
setup  $\langle \text{Sign.parent-path} \rangle$ 
```

```
declare case-split [cases type: bool]  
— prefer plain propositional version
```

```
lemma [code]:
```

```
  HOL.equal False P  $\longleftrightarrow \neg P$ 
```

```
  HOL.equal True P  $\longleftrightarrow P$ 
```

```
  HOL.equal P False  $\longleftrightarrow \neg P$ 
```

```
  HOL.equal P True  $\longleftrightarrow P$ 
```

```
  by (simp-all add: equal)
```

```
lemma [code nbe]:

```

14.2 The *unit* type

```
typedef unit = {True}
```

```
  by auto
```

```
definition Unity :: unit ( $\langle '() \rangle$ )
```

```
  where () = Abs-unit True
```

```
lemma unit-eq [no-atp]: u = ()
```

```
  by (induct u) (simp add: Unity-def)
```

Simplification procedure for *unit-eq*. Cannot use this rule directly — it loops!

```
simproc-setup unit-eq (x::unit) = ⟨
  K (K (fn ct =>
    if HOLogic.is-unit (Thm.term-of ct) then NONE
    else SOME (mk-meta-eq @{thm unit-eq})))
  ⟩
```

```
free-constructors case-unit for ()
  by auto
```

Avoid name clashes by prefixing the output of *old-rep-datatype* with *old*.

```
setup ⟨Sign.mandatory-path old⟩
```

```
old-rep-datatype () by simp
```

```
setup ⟨Sign.parent-path⟩
```

But erase the prefix for properties that are not generated by *free-constructors*.

```
setup ⟨Sign.mandatory-path unit⟩
```

```
lemmas induct = old.unit.induct
lemmas inducts = old.unit.inducts
lemmas rec = old.unit.rec
lemmas simps = unit.case unit.rec
```

```
setup ⟨Sign.parent-path⟩
```

```
lemma unit-all-eq1: (∧x::unit. PROP P x) ≡ PROP P ()
  by simp
```

```
lemma unit-all-eq2: (∧x::unit. PROP P) ≡ PROP P
  by (rule triv-forall-equality)
```

This rewrite counters the effect of *simproc unit-eq* on $\lambda u::unit. f\ u$, replacing it by *f* rather than by $\lambda u. f\ ()$.

```
lemma unit-abs-eta-conv [simp]: ( $\lambda u::unit. f\ ()$ ) = f
  by (rule ext) simp

14.3 The product type

14.3.1 Type definition

definition *Pair-Rep* $:: 'a \Rightarrow 'b \Rightarrow 'a \Rightarrow 'b \Rightarrow bool$
where *Pair-Rep* $a\ b = (\lambda x\ y. x = a \wedge y = b)$

definition *prod* $= \{f. \exists a\ b. f = Pair-Rep\ (a::'a)\ (b::'b)\}$

typedef (*'a, 'b*) *prod* ($\langle \langle notation = \langle infix\ \times \rangle - \times / - \rangle [21, 20]\ 20 \rangle = prod :: ('a \Rightarrow 'b \Rightarrow bool)\ set$
unfolding *prod-def* **by** *auto*

type-notation (*ASCII*)
prod (**infixr** $\langle * \rangle\ 20$)

definition *Pair* $:: 'a \Rightarrow 'b \Rightarrow 'a \times 'b$
where *Pair* $a\ b = Abs-prod\ (Pair-Rep\ a\ b)$

lemma *prod-cases*: $(\bigwedge a\ b. P\ (Pair\ a\ b)) \Longrightarrow P\ p$
by (*cases p*) (*auto simp add: prod-def Pair-def Pair-Rep-def*)

free-constructors *case-prod* **for** *Pair fst snd*

```

proof –
  fix  $P :: \text{bool}$  and  $p :: 'a \times 'b$ 
  show  $(\bigwedge x1\ x2. p = \text{Pair } x1\ x2 \implies P) \implies P$ 
    by (cases  $p$ ) (auto simp add: prod-def Pair-def Pair-Rep-def)
next
  fix  $a\ c :: 'a$  and  $b\ d :: 'b$ 
  have  $\text{Pair-Rep } a\ b = \text{Pair-Rep } c\ d \longleftrightarrow a = c \wedge b = d$ 
    by (auto simp add: Pair-Rep-def fun-eq-iff)
  moreover have  $\text{Pair-Rep } a\ b \in \text{prod}$  and  $\text{Pair-Rep } c\ d \in \text{prod}$ 
    by (auto simp add: prod-def)
  ultimately show  $\text{Pair } a\ b = \text{Pair } c\ d \longleftrightarrow a = c \wedge b = d$ 
    by (simp add: Pair-def Abs-prod-inject)
qed

```

Avoid name clashes by prefixing the output of *old-rep-datatype* with *old*.

```
setup <Sign.mandatory-path old>
```

```
old-rep-datatype Pair
  by (erule prod-cases) (rule prod.inject)
```

```
setup <Sign.parent-path>
```

But erase the prefix for properties that are not generated by *free-constructors*.

```
setup <Sign.mandatory-path prod>
```

```
declare old.prod.inject [iff del]
```

```

lemmas induct = old.prod.induct
lemmas inducts = old.prod.inducts
lemmas rec = old.prod.rec
lemmas_simps = prod.inject prod.case prod.rec

```

```
setup <Sign.parent-path>
```

```

declare prod.case [nitpick-simp del]
declare old.prod.case-cong-weak [cong del]
declare prod.case-eq-if [mono]
declare prod.split [no-atp]
declare prod.split-asm [no-atp]

```

prod.split could be declared as [*split*] done after the Splitter has been speeded up significantly; precompute the constants involved and don’t do anything unless the current goal contains one of those constants.

14.3.2 Tuple syntax

Patterns – extends pre-defined type *pttrn* used in abstractions.

```
nonterminal tuple-args and patterns
```

open-bundle *tuple-syntax*

begin

syntax

```

Class *normalization-semidom* cultivates the idea that each integral domain can be split into equivalence classes whose representants are associated, i.e. divide each other. *normalize* specifies a canonical representant for each equivalence class. The rationale behind this is that it is easier to reason about equality than equivalences, hence we prefer to think about equality of normalized values rather than associated elements.

We avoid an explicit definition of associated elements but prefer explicit normalisation instead. In theory we could define an abbreviation like *associated* $a\ b = (\text{normalize } a = \text{normalize } b)$ but this is counterproductive without suggestive infix syntax, which we do not want to sacrifice for this purpose here.

16.7 Ordered semirings and rings

The theory of partially ordered rings is taken from the books:

- *Lattice Theory* by Garret Birkhoff, American Mathematical Society, 1979
- *Partially Ordered Algebraic Systems*, Pergamon Press, 1963

Most of the used notions can also be looked up in

- <http://www.mathworld.com> by Eric Weisstein et. al.
- *Algebra I* by van der Waerden, Springer

```

17.11 Kleene’s fixed point theorem for continuous functions

Kleene’s fixed point theorem shows that the *lfp* of a omega-continuous function can be obtained as the supremum of an omega chain. It only requires an omega-complete partial order. We prove it here for complete lattices because the latter structures are not defined in Main but the theorem is also useful for complete lattices.

definition $omega\text{-}chain :: (nat \Rightarrow ('a::complete\text{-}lattice)) \Rightarrow bool$ **where**
 $omega\text{-}chain\ C = (\forall i. C\ i \leq C(Suc\ i))$

definition *omega-cont* :: (('a::complete-lattice) \Rightarrow ('b::complete-lattice)) \Rightarrow bool
where

omega-cont *f* = ($\forall C$. *omega-chain* *C* \longrightarrow *f*(*SUP* *n*. *C* *n*) = (*SUP* *n*. *f*(*C* *n*)))

lemma *omega-chain-mono*: *omega-chain* *C* \Longrightarrow *i* \leq *j* \Longrightarrow *C* *i* \leq *C* *j*

20.5 A basic fold functional for finite sets

The intended behaviour is $\text{fold } f \ z \ \{x_1, \dots, x_n\} = f \ x_1 \ (\dots (f \ x_n \ z) \dots)$ if f is “left-commutative”. The commutativity requirement is relativised to the carrier set S :

locale *comp-fun-commute-on* =
 fixes $S :: 'a \text{ set}$
 fixes $f :: 'a \Rightarrow 'b \Rightarrow 'b$
 assumes *comp-fun-commute-on*: $x \in S \Longrightarrow y \in S \Longrightarrow f \ y \circ f \ x = f \ x \circ f \ y$
begin

lemma *fun-left-comm*: $x \in S \Longrightarrow y \in S \Longrightarrow f \ y \ (f \ x \ z) = f \ x \ (f \ y \ z)$
 using *comp-fun-commute-on* **by** (*simp add: fun-eq-iff*)

lemma *commute-left-comp*: $x \in S \Longrightarrow y \in S \Longrightarrow f \ y \circ (f \ x \circ g) = f \ x \circ (f \ y \circ g)$
 by (*simp add: o-assoc comp-fun-commute-on*)

end

inductive *fold-graph* :: ($'a \Rightarrow 'b \Rightarrow 'b$) $\Rightarrow 'b \Rightarrow 'a \text{ set} \Rightarrow 'b \Rightarrow \text{bool}$
 for $f :: 'a \Rightarrow 'b \Rightarrow 'b$ **and** $z :: 'b$
 where
 emptyI [*intro*]: *fold-graph* $f \ z \ \{\}$ z
 | *insertI* [*intro*]: $x \notin A \Longrightarrow \text{fold-graph } f \ z \ A \ y \Longrightarrow \text{fold-graph } f \ z \ (\text{insert } x \ A) \ (f \ x \ y)$

inductive-cases *empty-fold-graphE* [*elim!*]: *fold-graph* $f \ z \ \{\}$ x

lemma *fold-graph-closed-lemma*:
 fold-graph $f \ z \ A \ x \wedge x \in B$
 if *fold-graph* $g \ z \ A \ x$
 $\bigwedge a \ b. a \in A \Longrightarrow b \in B \Longrightarrow f \ a \ b = g \ a \ b$
 $\bigwedge a \ b. a \in A \Longrightarrow b \in B \Longrightarrow g \ a \ b \in B$
 $z \in B$

```

using that(1-3)

shows $wf \ (\bigcup R)$

using *assms wf-UN[of R $\lambda i. i$]* **by** *simp*

Intuition: We find an $R \cup S$ -min element of a nonempty subset A by case distinction.

1. There is a step $a -R\rightarrow b$ with $a, b \in A$. Pick an R -min element z of the (nonempty) set $\{a \in A \mid \exists b \in A. a -R\rightarrow b\}$. By definition, there is $z' \in A$ s.t. $z -R\rightarrow z'$. Because z is R -min in the subset, z' must be R -min in A . Because z' has an R -predecessor, it cannot have an S -successor and is thus S -min in A as well.
2. There is no such step. Pick an S -min element of A . In this case it must be an R -min element of A as well.

lemma *finite-acyclic-wf-converse*: finite r \implies acyclic r \implies wf (r⁻¹)
apply (erule finite-converse [THEN iffD2, THEN finite-acyclic-wf])
apply (erule acyclic-converse [THEN iffD2])
done

Observe that the converse of an irreflexive, transitive, and finite relation is again well-founded. Thus, we may employ it for well-founded induction.

22.13 Code Generation Setup

Code equations with *wf* or *wfp* on the left-hand side are not supported by the code generation module because of the *UNIV* hidden behind the abbreviations. To sidestep this problem, we provide the following wrapper definitions and use *code-abbrev* to register the definitions with the pre- and post-processors of the code generator.

definition *wf-code* :: $('a \times 'a)\ set \Rightarrow bool$ **where**

[*code-abbrev*]: *wf-code* $r \longleftrightarrow wf\ r$

definition *wfp-code* :: $('a \Rightarrow 'a \Rightarrow bool) \Rightarrow bool$ **where**

[*code-abbrev*]: *wfp-code* $R \longleftrightarrow wfp\ R$

end

24.5.2 The upper and lower bounds operators

Here we define upper (“above”) and lower (“below”) bounds operators. We think of r as a *non-strict* relation. The suffix S at the names of some operators indicates that the bounds are strict – e.g., *underS* a is the set of all strict lower bounds of a (w.r.t. r). Capitalization of the first letter in the name reminds that the operator acts on sets, rather than on individual elements.

definition *under* :: $'a \text{ rel} \Rightarrow 'a \Rightarrow 'a \text{ set}$
 where *under* $r \ a \equiv \{b. (b, a) \in r\}$

definition *underS* :: $'a \text{ rel} \Rightarrow 'a \Rightarrow 'a \text{ set}$
 where *underS* $r \ a \equiv \{b. b \neq a \wedge (b, a) \in r\}$

definition *Under* :: $'a \text{ rel} \Rightarrow 'a \text{ set} \Rightarrow 'a \text{ set}$
 where *Under* $r \ A \equiv \{b \in \text{Field } r. \forall a \in A. (b, a) \in r\}$

definition *UnderS* :: $'a \text{ rel} \Rightarrow 'a \text{ set} \Rightarrow 'a \text{ set}$
 where *UnderS* $r \ A \equiv \{b \in \text{Field } r. \forall a \in A. b \neq a \wedge (b, a) \in r\}$

definition *above* :: $'a \text{ rel} \Rightarrow 'a \Rightarrow 'a \text{ set}$
 where *above* $r \ a \equiv \{b. (a, b) \in r\}$

definition *aboveS* :: $'a \text{ rel} \Rightarrow 'a \Rightarrow 'a \text{ set}$
 where *aboveS* $r \ a \equiv \{b. b \neq a \wedge (a, b) \in r\}$

definition *Above* :: $'a \text{ rel} \Rightarrow 'a \text{ set} \Rightarrow 'a \text{ set}$
 where *Above* $r \ A \equiv \{b \in \text{Field } r. \forall a \in A. (a, b) \in r\}$

definition *AboveS* :: $'a \text{ rel} \Rightarrow 'a \text{ set} \Rightarrow 'a \text{ set}$
 where *AboveS* $r \ A \equiv \{b \in \text{Field } r. \forall a \in A. b \neq a \wedge (a, b) \in r\}$

definition *ofilter* :: $'a \text{ rel} \Rightarrow 'a \text{ set} \Rightarrow \text{bool}$
 where *ofilter* $r \ A \equiv A \subseteq \text{Field } r \wedge (\forall a \in A. \text{under } r \ a \subseteq A)$

Note: In the definitions of $Above[S]$ and $Under[S]$, we bounded comprehension by $Field\ r$ in order to properly cover the case of A being empty.

24.6 Variations on Well-Founded Relations

This subsection contains some variations of the results from *HOL.Wellfounded*:

- means for slightly more direct definitions by well-founded recursion;
- variations of well-founded induction;
- means for proving a linear order to be a well-order.

24.6.1 Characterizations of well-foundedness

A transitive relation is well-founded iff it is “locally” well-founded, i.e., iff its restriction to the lower bounds of any element is well-founded.

```

lemma trans-wf-iff:
  assumes trans r
  shows  $wf\ r \longleftrightarrow (\forall a. wf\ (r \cap (r^{-1} \mathbin{''} \{a\} \times r^{-1} \mathbin{''} \{a\})))$ 
proof –
  define R where  $R\ a = r \cap (r^{-1} \mathbin{''} \{a\} \times r^{-1} \mathbin{''} \{a\})$  for a
  have  $wf\ (R\ a)$  if  $wf\ r$  for a

```

```

    using that R-def wf-subset[of r R a] by auto
  moreover
  have wf r if *:  $\forall a. wf(R a)$ 
    unfolding wf-def
  proof clarify
    fix phi a
    assume **:  $\forall a. (\forall b. (b, a) \in r \longrightarrow phi b) \longrightarrow phi a$ 
    define chi where chi b  $\longleftrightarrow (b, a) \in r \longrightarrow phi b$  for b
    with * have wf (R a) by auto
    then have  $(\forall b. (\forall c. (c, b) \in R a \longrightarrow chi c) \longrightarrow chi b) \longrightarrow (\forall b. chi b)$ 
      unfolding wf-def by blast
    also have  $\forall b. (\forall c. (c, b) \in R a \longrightarrow chi c) \longrightarrow chi b$ 
  proof safe
    fix b
    assume  $\forall c. (c, b) \in R a \longrightarrow chi c$ 
    moreover have  $(b, a) \in r \implies \forall c. (c, b) \in r \wedge (c, a) \in r \longrightarrow phi c \implies phi$ 
  b
    proof -
      assume  $(b, a) \in r$  and  $\forall c. (c, b) \in r \wedge (c, a) \in r \longrightarrow phi c$ 
      then have  $\forall c. (c, b) \in r \longrightarrow phi c$ 
        using assms trans-def[of r] by blast
      with ** show phi b by blast
    qed
    ultimately show chi b
      by (auto simp add: chi-def R-def)
    qed
    finally have  $\forall b. chi b$  .
    with ** chi-def show phi a by blast
  qed
  ultimately show ?thesis unfolding R-def by blast
qed

```

A transitive relation is well-founded if all initial segments are finite.

corollary *wf-finite-segments*:

```

  assumes irrefl r and trans r and  $\bigwedge x. finite \{y. (y, x) \in r\}$ 
  shows wf r
  proof -
    have  $\bigwedge a. acyclic (r \cap \{x. (x, a) \in r\} \times \{x. (x, a) \in r\})$ 
  proof -
    fix a
    have trans  $(r \cap (\{x. (x, a) \in r\} \times \{x. (x, a) \in r\}))$ 
      using assms unfolding trans-def Field-def by blast
    then show acyclic  $(r \cap \{x. (x, a) \in r\} \times \{x. (x, a) \in r\})$

```

Every infinite set contains a countable subset. More precisely we show that a set S is infinite if and only if there exists an injective function from the naturals into S .

The “only if” direction is harder because it requires the construction of a sequence of pairwise different elements of an infinite set S . The idea is to construct a sequence of non-empty and infinite subsets of S obtained by successively removing elements of S .

lemma *infinite-countable-subset*:

26 Zorn’s Lemma and the Well-ordering Theorem

```
theory Zorn
  imports Order-Relation Hilbert-Choice
begin
```

26.1 Zorn’s Lemma for the Subset Relation

26.1.1 Results that do not require an order

Let P be a binary predicate on the set A .

```
locale pred-on =
  fixes A :: 'a set
  and P :: 'a  $\Rightarrow$  'a  $\Rightarrow$  bool (infix <math>\sqsubseteq</math> 50)
begin
```

```
abbreviation Peq :: 'a  $\Rightarrow$  'a  $\Rightarrow$  bool (infix <math>\sqsubseteq</math> 50)
  where  $x \sqsubseteq y \equiv P^{==} x y$ 
```

A chain is a totally ordered subset of A .

```
definition chain :: 'a set  $\Rightarrow$  bool
  where chain C  $\longleftrightarrow C \subseteq A \wedge (\forall x \in C. \forall y \in C. x \sqsubseteq y \vee y \sqsubseteq x)$ 
```

We call a chain that is a proper superset of some set X , but not necessarily a chain itself, a superchain of X .

```
abbreviation superchain :: 'a set  $\Rightarrow$  'a set  $\Rightarrow$  bool (infix <math><_c</math> 50)
  where  $X <_c C \equiv \text{chain } C \wedge X \subset C$ 
```

A maximal chain is a chain that does not have a superchain.

```
definition maxchain :: 'a set  $\Rightarrow$  bool
  where maxchain C  $\longleftrightarrow \text{chain } C \wedge (\nexists S. C <_c S)$ 
```

We define the successor of a set to be an arbitrary superchain, if such exists, or the set itself, otherwise.

```
definition suc :: 'a set  $\Rightarrow$  'a set
  where suc C = (if  $\neg \text{chain } C \vee \text{maxchain } C$  then C else (SOME D. C <math><_c</math> D))

  by (simp add: suc-def)
```

```
lemma maxchain-suc [simp]:  $\text{maxchain } X \Longrightarrow \text{suc } X = X$ 
```

by (*simp add: suc-def*)

lemma *suc-subset*: $X \subseteq \text{suc } X$

by (*auto simp: suc-def maxchain-def intro: someI2*)

lemma *chain-empty* [*simp*]: $\text{chain } \{\}$

by (*auto simp: chain-def*)

lemma *not-maxchain-Some*: $\text{chain } C \implies \neg \text{maxchain } C \implies C <_c (\text{SOME } D. C <_c D)$

by (*rule someI-ex*) (*auto simp: maxchain-def*)

lemma *suc-not-equals*: $\text{chain } C \implies \neg \text{maxchain } C \implies \text{suc } C \neq C$

using *not-maxchain-Some* **by** (*auto simp: suc-def*)

lemma *subset-suc*:

assumes $X \subseteq Y$

shows $X \subseteq \text{suc } Y$

using *assms* **by** (*rule subset-trans*) (*rule suc-subset*)

We build a set \mathcal{C} that is closed under applications of *suc* and contains the union of all its subsets.

inductive-set *suc-Union-closed* ($\langle \mathcal{C} \rangle$)

where

$\text{suc}: X \in \mathcal{C} \implies \text{suc } X \in \mathcal{C}$

| *Union* [*unfolded Pow-iff*]: $X \in \text{Pow } \mathcal{C} \implies \bigcup X \in \mathcal{C}$

Since the empty set as well as the set itself is a subset of every set, \mathcal{C} contains at least $\{\} \in \mathcal{C}$ and $\bigcup \mathcal{C} \in \mathcal{C}$.

lemma *suc-Union-closed-empty*: $\{\} \in \mathcal{C}$

and *suc-Union-closed-Union*: $\bigcup \mathcal{C} \in \mathcal{C}$

using *Union* [*of* $\{\}$] **and** *Union* [*of* \mathcal{C}] **by** *simp-all*

Thus closure under *suc* will hit a maximal chain eventually, as is shown below.

lemma *suc-Union-closed-induct* [*consumes 1*, *case-names suc Union*, *induct pred: suc-Union-closed*]:

assumes $X \in \mathcal{C}$

and $\bigwedge X. X \in \mathcal{C} \implies Q X \implies Q (\text{suc } X)$

and $\bigwedge X. X \subseteq \mathcal{C} \implies \forall x \in X. Q x \implies Q (\bigcup X)$

shows $Q X$

using *assms* **by** *induct blast+*

lemma *suc-Union-closed-cases* [*consumes 1*, *case-names suc Union*, *cases pred: suc-Union-closed*]:

assumes $X \in \mathcal{C}$

and $\bigwedge Y. X = \text{suc } Y \implies Y \in \mathcal{C} \implies Q$

and $\bigwedge Y. X = \bigcup Y \implies Y \subseteq \mathcal{C} \implies Q$

shows Q
 using *assms* by *cases simp-all*

On chains, *suc* yields a chain.

27.2 Well-founded induction and recursion adapted to non-strict well-order relations

Here we provide induction and recursion principles specific to *non-strict* well-order relations. Although minor variations of those for well-founded relations, they will be useful for doing away with the tediousness of having to take out the diagonal each time in order to switch to a well-founded relation.

```

27.3 The notions of maximum, minimum, supremum, successor and order filter

We define the successor *of a set*, and not of an element (the latter is of course a particular case). Also, we define the maximum *of two elements*, *max2*, and the minimum *of a set*, *minim* – we chose these variants since we consider them the most useful for well-orders. The minimum is defined in terms of the auxiliary relational operator *isMinim*. Then, supremum and successor are defined in terms of minimum as expected. The minimum is only meaningful for non-empty sets, and the successor is only meaningful for sets for which strict upper bounds exist. Order filters for well-orders are also known as “initial segments”.

definition *max2* :: '*a* \Rightarrow '*a* \Rightarrow '*a*
where *max2* *a* *b* \equiv *if* (*a*,*b*) \in *r* *then* *b* *else* *a*
definition *isMinim* :: '*a* *set* \Rightarrow '*a* \Rightarrow *bool*
where *isMinim* *A* *b* \equiv *b* \in *A* \wedge (\forall *a* \in *A*. (*b*,*a*) \in *r*)

definition *minim* :: '*a* *set* \Rightarrow '*a*
where *minim* *A* \equiv *THE* *b*. *isMinim* *A* *b*
definition *supr* :: '*a* *set* \Rightarrow '*a*
where *supr* *A* \equiv *minim* (*Above* *A*)

definition *suc* :: '*a* *set* \Rightarrow '*a*

28 Well-Order Embeddings as Needed by Bounded Natural Functors

```

theory BNF-Wellorder-Embedding
  imports Hilbert-Choice BNF-Wellorder-Relation
begin

```

In this section, we introduce well-order *embeddings* and *isomorphisms* and prove their basic properties. The notion of embedding is considered from the point of view of the theory of ordinals, and therefore requires the source to be injected as an *initial segment* (i.e., *order filter*) of the target. A main result of this section is the existence of embeddings (in one direction or another) between any two well-orders, having as a consequence the fact that, given any two sets on any two types, one is smaller than (i.e., can be injected into) the other.

28.2 (Well-order) embeddings, strict embeddings, isomorphisms and order-compatible functions

Standardly, a function is an embedding of a well-order in another if it injectively and order-compatibly maps the former into an order filter of the latter. Here we opt for a more succinct definition (operator *embed*), asking that, for any element in the source, the function should be a bijection between the set of strict lower bounds of that element and the set of strict lower bounds of its image. (Later we prove equivalence with the standard definition – lemma *embed-iff-compat-inj-on-ofilter*.) A *strict embedding* (operator *embedS*) is a non-bijective embedding and an isomorphism (operator *iso*) is a bijective embedding.

definition *embed* :: $'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow ('a \Rightarrow 'a') \Rightarrow \text{bool}$

where

$\text{embed } r \ r' \ f \equiv \forall a \in \text{Field } r. \text{bij-betw } f (\text{under } r \ a) (\text{under } r' (f a))$

lemmas *embed-defs* = *embed-def embed-def*[*abs-def*]

Strict embeddings:

definition *embedS* :: $'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow ('a \Rightarrow 'a') \Rightarrow \text{bool}$

where

$\text{embedS } r \ r' \ f \equiv \text{embed } r \ r' \ f \wedge \neg \text{bij-betw } f (\text{Field } r) (\text{Field } r')$

lemmas *embedS-defs* = *embedS-def embedS-def*[*abs-def*]

28.3 Given any two well-orders, one can be embedded in the other

Here is an overview of the proof of of this fact, stated in theorem *wellorders-totally-ordered*:

Fix the well-orders $r::'a \text{ rel}$ and $r'::'a' \text{ rel}$. Attempt to define an embedding $f::'a \Rightarrow 'a'$ from r to r' in the natural way by well-order recursion ("hoping" that $\text{Field } r$ turns out to be smaller than $\text{Field } r'$), but also record, at the recursive step, in a function $g::'a \Rightarrow \text{bool}$, the extra information of whether

Field r' gets exhausted or not.

If *Field* r' does not get exhausted, then *Field* r is indeed smaller and f is the desired embedding from r to r' (lemma *wellorders-totally-ordered-aux*). Otherwise, it means that *Field* r' is the smaller one, and the inverse of (the "good" segment of) f is the desired embedding from r' to r (lemma *wellorders-totally-ordered-aux2*).

lemma *wellorders-totally-ordered-aux*:

fixes $r :: 'a \text{ rel}$ **and** $r' :: 'a' \text{ rel}$ **and**

$f :: 'a \Rightarrow 'a'$ **and** $a :: 'a$

assumes *WELL*: *Well-order* r **and** *WELL'*: *Well-order* r' **and** *IN*: $a \in \text{Field } r$ **and**

IH: $\forall b \in \text{underS } r \ a. \text{bij-betw } f \ (\text{under } r \ b) \ (\text{under } r' \ (f \ b))$ **and**

NOT: $f' \ (\text{underS } r \ a) \neq \text{Field } r'$ **and** *SUC*: $f \ a = \text{wo-rel.suc } r' \ (f'(\text{underS } r \ a))$

shows $\text{bij-betw } f \ (\text{under } r \ a) \ (\text{under } r' \ (f \ a))$

28.4 Uniqueness of embeddings

Here we show a fact complementary to the one from the previous subsection – namely, that between any two well-orders there is *at most* one embedding, and is the one definable by the expected well-order recursive equation. As a consequence, any two embeddings of opposite directions are mutually inverse.

lemma *embed-determined*:

```

  assumes WELL: Well-order  $r$  and WELL': Well-order  $r'$  and
    EMB:  $\text{embed } r\ r'\ f$  and IN:  $a \in \text{Field } r$ 
  shows  $f\ a = \text{wo-rel.suc } r'\ (f'(\text{underS } r\ a))$ 
proof –
  have  $\text{bij-betw } f\ (\text{underS } r\ a)\ (\text{underS } r'\ (f\ a))$ 
    using assms by (auto simp add: embed-underS)
  hence  $f'(\text{underS } r\ a) = \text{underS } r'\ (f\ a)$ 
    by (auto simp add: bij-betw-def)
  moreover
  { have  $f\ a \in \text{Field } r'$  using IN
    using EMB WELL embed-Field[of  $r\ r'\ f$ ] by auto

29 Constructions on Wellorders as Needed by Bounded Natural Functors

```

theory BNF-Wellorder-Constructions
imports BNF-Wellorder-Embedding
begin

```

In this section, we study basic constructions on well-orders, such as restriction to a set/order filter, copy via direct images, ordinal-like sum of disjoint well-orders, and bounded square. We also define between well-orders the relations *ordLeq*, of being embedded (abbreviated $\leq o$), *ordLess*, of being strictly embedded (abbreviated $< o$), and *ordIso*, of being isomorphic (abbreviated $= o$). We study the connections between these relations, order filters, and the aforementioned constructions. A main result of this section is that $< o$ is well-founded.

29.1 Restriction to a set

```

abbreviation Restr :: 'a rel  $\Rightarrow$  'a set  $\Rightarrow$  'a rel
where Restr r A  $\equiv$  r Int (A  $\times$  A)

```

```

29.4 Ordering the well-orders by existence of embeddings

We define three relations between well-orders:

- *ordLeq*, of being embedded (abbreviated $\leq o$);
- *ordLess*, of being strictly embedded (abbreviated $< o$);
- *ordIso*, of being isomorphic (abbreviated $= o$).

The prefix "ord" and the index "o" in these names stand for "ordinal-like". These relations shall be proved to be inter-connected in a similar fashion as the trio $\leq, <, =$ associated to a total order on a set.

definition $\text{ordLeq} :: ('a \text{ rel} * 'a' \text{ rel}) \text{ set}$
where
 $\text{ordLeq} = \{(r, r'). \text{ Well-order } r \wedge \text{ Well-order } r' \wedge (\exists f. \text{ embed } r \ r' \ f)\}$

abbreviation $\text{ordLeq2} :: 'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow \text{bool}$ (**infix** $\langle \leq_o \rangle$ 50)
where $r \leq_o r' \equiv (r, r') \in \text{ordLeq}$

abbreviation $\text{ordLeq3} :: 'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow \text{bool}$ (**infix** $\langle \leq_o \rangle$ 50)
where $r \leq_o r' \equiv r \leq_o r'$

definition $\text{ordLess} :: ('a \text{ rel} * 'a' \text{ rel}) \text{ set}$
where
 $\text{ordLess} = \{(r, r'). \text{ Well-order } r \wedge \text{ Well-order } r' \wedge (\exists f. \text{ embedS } r \ r' \ f)\}$

abbreviation $\text{ordLess2} :: 'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow \text{bool}$ (**infix** $\langle <_o \rangle$ 50)
where $r <_o r' \equiv (r, r') \in \text{ordLess}$

definition $\text{ordIso} :: ('a \text{ rel} * 'a' \text{ rel}) \text{ set}$
where
 $\text{ordIso} = \{(r, r'). \text{ Well-order } r \wedge \text{ Well-order } r' \wedge (\exists f. \text{ iso } r \ r' \ f)\}$

abbreviation $\text{ordIso2} :: 'a \text{ rel} \Rightarrow 'a' \text{ rel} \Rightarrow \text{bool}$ (**infix** $\langle =_o \rangle$ 50)
where $r =_o r' \equiv (r, r') \in \text{ordIso}$

lemmas $\text{ordRels-def} = \text{ordLeq-def } \text{ordLess-def } \text{ordIso-def}$

lemma $\text{ordLeq-Well-order-simp}$:
assumes $r \leq_o r'$
shows $\text{Well-order } r \wedge \text{ Well-order } r'$
using *assms* **unfolding** ordLeq-def **by** *simp*

Notice that the relations $\leq_o, <_o, =_o$ connect well-orders on potentially *distinct* types. However, some of the lemmas below, including the next one, restrict implicitly the type of these relations to $(('a \text{ rel}) * ('a' \text{ rel})) \text{ set}$, i.e., to $'a \text{ rel rel}$.

29.5 $<_o$ is well-founded

Of course, it only makes sense to state that the $<_o$ is well-founded on the restricted type $'a\ \text{rel}\ \text{rel}$. We prove this by first showing that, for any set of well-orders all embedded in a fixed well-order, the function mapping each well-order in the set to an order filter of the fixed well-order is compatible w.r.t. to $<_o$ versus *strict inclusion*; and we already know that strict inclusion of order filters is well-founded.

definition *ord-to-filter* $:: 'a\ \text{rel} \Rightarrow 'a\ \text{rel} \Rightarrow 'a\ \text{set}$
where *ord-to-filter* $r0\ r \equiv (\text{SOME } f. \text{ embed } r\ r0\ f) \ '(\text{Field } r)$

lemma *ord-to-filter-compat*:

$\text{compat } (\text{ordLess } \text{Int } (\text{ordLess}^{-1} \{r0\} \times \text{ordLess}^{-1} \{r0\}))$
 $(\text{ofilterIncl } r0)$
 $(\text{ord-to-filter } r0)$

proof(*unfold compat-def ord-to-filter-def, clarify*)

fix $r1::'a\ \text{rel}$ **and** $r2::'a\ \text{rel}$
let $?A1 = \text{Field } r1$ **let** $?A2 = \text{Field } r2$ **let** $?A0 = \text{Field } r0$
let $?phi10 = \lambda f10. \text{ embed } r1\ r0\ f10$ **let** $?f10 = \text{SOME } f. ?phi10\ f$
let $?phi20 = \lambda f20. \text{ embed } r2\ r0\ f20$ **let** $?f20 = \text{SOME } f. ?phi20\ f$
assume $*$: $r1 <_o r0\ r2 <_o r0$ **and** $**$: $r1 <_o r2$
hence $(\exists f. ?phi10\ f) \wedge (\exists f. ?phi20\ f)$

29.7 Bounded square

This construction essentially defines, for an order relation r , a lexicographic order *bsqr* r on $(\text{Field } r) \times (\text{Field } r)$, applying the following criteria (in this order):

- compare the maximums;
- compare the first components;
- compare the second components.

The only application of this construction that we are aware of is at proving that the square of an infinite set has the same cardinal as that set. The essential property required there (and which is ensured by this construction) is that any proper order filter of the product order is included in a rectangle, i.e., in a product of proper filters on the original relation (assumed to be a well-order).

definition *bsqr* :: $'a \text{ rel} \implies ('a * 'a) \text{rel}$
where

$$\begin{aligned}
& \text{bsqr } r = \{((a1, a2), (b1, b2)). \\
& \quad \{a1, a2, b1, b2\} \leq \text{Field } r \wedge \\
& \quad (a1 = b1 \wedge a2 = b2 \vee \\
& \quad (\text{wo-rel.max2 } r \ a1 \ a2, \text{wo-rel.max2 } r \ b1 \ b2) \in r - \text{Id} \vee \\
& \quad \text{wo-rel.max2 } r \ a1 \ a2 = \text{wo-rel.max2 } r \ b1 \ b2 \wedge (a1, b1) \in r - \text{Id} \vee \\
& \quad \text{wo-rel.max2 } r \ a1 \ a2 = \text{wo-rel.max2 } r \ b1 \ b2 \wedge a1 = b1 \wedge (a2, b2) \in r \\
& - \text{Id} \\

30 Cardinal-Order Relations as Needed by Bounded Natural Functors

```

theory BNF-Cardinal-Order-Relation
  imports Zorn BNF-Wellorder-Constructions
begin

```

In this section, we define cardinal-order relations to be minim well-orders on their field. Then we define the cardinal of a set to be *some* cardinal-order relation on that set, which will be unique up to order isomorphism. Then we study the connection between cardinals and:

- standard set-theoretic constructions: products, sums, unions, lists, powersets, set-of finite sets operator;
- finiteness and infiniteness (in particular, with the numeric cardinal operator for finite sets, *card*, from the theory *Finite-Sets.thy*).

On the way, we define the canonical ω cardinal and finite cardinals. We also define (again, up to order isomorphism) the successor of a cardinal, and show that any cardinal admits a successor.

Main results of this section are the existence of cardinal relations and the facts that, in the presence of infiniteness, most of the standard set-theoretic constructions (except for the powerset) *do not increase cardinality*. In particular, e.g., the set of words/lists over any infinite set has the same cardinality (hence, is in bijection) with that set.

30.1 Cardinal orders

A cardinal order in our setting shall be a well-order *minim* w.r.t. the order-embedding relation, \leq_o (which is the same as being *minimal* w.r.t. the strict order-embedding relation, $<_o$), among all the well-orders on its field.

definition *card-order-on* :: 'a set \Rightarrow 'a rel \Rightarrow bool

where

card-order-on A r \equiv *well-order-on* A r \wedge ($\forall r'. \text{well-order-on } A \ r' \longrightarrow r \leq_o r'$)

abbreviation *Card-order* r \equiv *card-order-on* (Field r) r

abbreviation *card-order* r \equiv *card-order-on* UNIV r

lemma *card-order-on-well-order-on*:

assumes *card-order-on* A r

shows *well-order-on* A r

using *assms* **unfolding** *card-order-on-def* **by** *simp*

lemma *card-order-on-Card-order*:

card-order-on A r \implies A = Field r \wedge *Card-order* r

unfolding *card-order-on-def* **using** *well-order-on-Field* **by** *blast*

The existence of a cardinal relation on any given set (which will mean that any set has a cardinal) follows from two facts:

- Zermelo’s theorem (proved in *Zorn.thy* as theorem *well-order-on*), which states that on any given set there exists a well-order;
- The well-founded-ness of $<_o$, ensuring that then there exists a minimal such well-order, i.e., a cardinal order.

theorem *card-order-on*: $\exists r. \text{card-order-on } A \ r$

proof –

30.2 Cardinal of a set

We define the cardinal of set to be *some* cardinal order on that set. We shall prove that this notion is unique up to order isomorphism, meaning that order isomorphism shall be the true identity of cardinals.

definition *card-of* :: '*a set* \Rightarrow '*a rel* ($\langle \langle \text{open-block notation} = \langle \text{mixfix card-of} \rangle \rangle | \cdot | \rangle \rangle$)

30.4 Cardinals versus set operations involving infinite sets

Here we show that, for infinite sets, most set-theoretic constructions do not increase the cardinality. The cornerstone for this is theorem *Card-order-Times-same-infinite*, which states that self-product does not increase cardinality – the proof of this fact adapts a standard set-theoretic argument, as presented, e.g., in the proof of theorem 1.5.11 at page 47 in [4]. Then everything else follows fairly easily.

lemma *infinite-iff-card-of-nat*:

\neg *finite A* \longleftrightarrow ($|UNIV::nat\ set| \leq_o |A|$)

unfolding *infinite-iff-countable-subset card-of-ordLeq ..*

The next two results correspond to the ZF fact that all infinite cardinals are limit ordinals:

lemma *Card-order-infinite-not-under*:

30.6 The successor of a cardinal

First we define $isCardSuc\ r\ r'$, the notion of r' being a successor cardinal of r . Although the definition does not require r to be a cardinal, only this case will be meaningful.

definition $isCardSuc :: 'a\ rel \Rightarrow 'a\ set\ rel \Rightarrow bool$
where
 $isCardSuc\ r\ r' \equiv$
 $Card-order\ r' \wedge r <o r' \wedge$
 $(\forall (r'': 'a\ set\ rel). Card-order\ r'' \wedge r <o r'' \longrightarrow r' \leq_o r'')$

Now we introduce the cardinal-successor operator $cardSuc$, by picking *some* cardinal-order relation fulfilling $isCardSuc$. Again, the picked item shall be proved unique up to order-isomorphism.

definition $cardSuc :: 'a\ rel \Rightarrow 'a\ set\ rel$
where $cardSuc\ r \equiv SOME\ r'.\ isCardSuc\ r\ r'$

lemma $exists-minim-Card-order$:
 $\llbracket R \neq \{\}; \forall r \in R. Card-order\ r \rrbracket \Longrightarrow \exists r \in R. \forall r' \in R. r \leq_o r'$

unfolding *card-order-on-def* **using** *exists-minim-Well-order* **by** *blast*

lemma *exists-isCardSuc*:

assumes *Card-order* *r*

shows $\exists r'. \text{isCardSuc } r \ r'$

proof –

let $?R = \{(r'::'a \text{ set rel}). \text{Card-order } r' \wedge r <_o r'\}$

have $|\text{Pow}(\text{Field } r)| \in ?R \wedge (\forall r \in ?R. \text{Card-order } r)$ **using** *assms*

by (*simp add: card-of-Card-order Card-order-Pow*)

then obtain *r* **where** $r \in ?R \wedge (\forall r' \in ?R. r \leq_o r')$

using *exists-minim-Card-order[of ?R]* **by** *blast*

thus *?thesis* **unfolding** *isCardSuc-def* **by** *auto*

qed

lemma *cardSuc-isCardSuc*:

assumes *Card-order* *r*

shows *isCardSuc* *r* (*cardSuc* *r*)

unfolding *cardSuc-def* **using** *assms*

by (*simp add: exists-isCardSuc someI-ex*)

lemma *cardSuc-Card-order*:

Card-order *r* \implies *Card-order* (*cardSuc* *r*)

using *cardSuc-isCardSuc* **unfolding** *isCardSuc-def* **by** *blast*

lemma *cardSuc-greater*:

Card-order *r* $\implies r <_o \text{cardSuc } r$

using *cardSuc-isCardSuc* **unfolding** *isCardSuc-def* **by** *blast*

lemma *cardSuc-ordLeq*:

Card-order *r* $\implies r \leq_o \text{cardSuc } r$

using *cardSuc-greater ordLeq-iff-ordLess-or-ordIso* **by** *blast*

The minimality property of *cardSuc* originally present in its definition is local to the type *'a set rel*, i.e., that of *cardSuc* *r*:

lemma *cardSuc-least-aux*:

$\llbracket \text{Card-order } (r::'a \text{ rel}); \text{Card-order } (r'::'a \text{ set rel}); r <_o r' \rrbracket \implies \text{cardSuc } r \leq_o r'$

using *cardSuc-isCardSuc* **unfolding** *isCardSuc-def* **by** *blast*

But from this we can infer general minimality:

lemma *cardSuc-least*:

assumes *CARD*: *Card-order* *r* **and** *CARD'*: *Card-order* *r'* **and** *LESS*: $r <_o r'$

shows $\text{cardSuc } r \leq_o r'$

proof –

let $?p = \text{cardSuc } r$

have *0*: *Well-order* $?p \wedge \text{Well-order } r'$

using *assms cardSuc-Card-order* **unfolding** *card-order-on-def* **by** *blast*

{ assume $r' <_o ?p$

then obtain r'' **where** *1*: *Field* $r'' < \text{Field } ?p$ **and** *2*: $r' =_o r'' \wedge r'' <_o ?p$

using *internalize-ordLess[of r' ?p]* **by** *blast*

have *Card-order* r'' using *CARD'* *Card-order-ordIso2 2* by *blast*

lemma *fChoice-iff-Ex*: *P (fChoice P) \longleftrightarrow HOL.Ex P*

unfolding *fChoice-def*

by *(fact some-eq-ex)*

We use the *Ex* constant on the right-hand side of *fChoice-iff-Ex* because we want to use the TPTP-native version if *fChoice* is introduced in a logic that supports FOOL. In logics that don't support it, it gets replaced by *fEx* during processing. Notice that we cannot use $\exists x. P x$, as existentials are not skolemized by the metis proof method but *Ex P* is eta-expanded if FOOL is supported.

The *eq-numeral-iff-iszero* lemmas are not declared [*simp*] by default, because for rings of characteristic zero, better simp rules are possible. For a type like

integers mod n , type-instantiated versions of these rules should be added to the simplifier, along with a type-specific rule for deciding propositions of the form *iszero* (*numeral* w).

bh: Maybe it would not be so bad to just declare these as simp rules anyway? I should test whether these rules take precedence over the *ring-char-0* rules in the simplifier.

54.18 Powers with integer exponents

The following allows writing powers with an integer exponent. While the type signature is very generic, most theorems will assume that the underlying type is a division ring or a field.

The notation ‘powi’ is inspired by the ‘powr’ notation for real/complex exponentiation.

definition *power-int* :: 'a :: {inverse, power} \Rightarrow int \Rightarrow 'a (**infixr** <powi> 80) **where**
power-int x n = (if n \geq 0 then x $^{\wedge}$ nat n else inverse x $^{\wedge}$ (nat (-n)))

lemma *power-int-0-right* [simp]: *power-int* x 0 = 1
and *power-int-1-right* [simp]:
power-int (y :: 'a :: {power, inverse, monoid-mult}) 1 = y
and *power-int-minus1-right* [simp]:
power-int (y :: 'a :: {power, inverse, monoid-mult}) (-1) = inverse y
by (simp-all add: power-int-def)
