## Abstract

This document lists the main types, functions and syntax provided by theory *Main*. It is meant as a quick overview of what is available. For infix operators and their precedences see the final section. The sophisticated class structure is only hinted at. For details see <https://isabelle.in.tum.de/library/HOL/HOL>.

$inv\_into :: 'a\ set \Rightarrow ('a \Rightarrow 'b) \Rightarrow 'b \Rightarrow 'a$

## Syntax

## Fixed Points

Theory: *HOL.Inductive*.

Least and greatest fixed points in a complete lattice 'a:

$lfp :: ('a \Rightarrow 'a) \Rightarrow 'a$

$gfp :: ('a \Rightarrow 'a) \Rightarrow 'a$

Note that in particular sets ( $'a \Rightarrow bool$ ) are complete lattices.

$\lambda(x, y). t$   $\equiv case\_prod\ (\lambda x\ y. t)$

Pairs may be nested. Nesting to the right is printed as a tuple, e.g.  $(a, b, c)$  is really  $(a, (b, c))$ . Pattern matching with pairs and tuples extends to all binders, e.g.  $\forall (x, y) \in A. P$ ,  $\{(x, y). P\}$ , etc.
