Hilbert's Paradox in ℕaproche

Marcel Schütz

2025

Hilbert's Paradox, discovered around 1900 by David Hilbert, demonstates that there cannot exists a set that is closed under powersets and under unions of arbitrary subsets [1].

Theorem 1 (Hilbert's Paradox). There exists no system of sets that is closed under powersets and closed under unions.

Proof. Assume the contrary. Consider a system of sets S that is closed under powersets and closed under unions. We have $S \subset S$. Hence $\bigcup S \in S$. Thus $\mathcal{P}(\bigcup S) \in S$. Contradiction. ■

Using Hilbert's Paradox it can further be shown that there exists no universal set, i.e. that the class $\mathbb{V}$ of all sets is a proper class:

Corollary 2. $\mathbb{V}$ is not a set.

Proof. Assume the contrary. Then $\mathbb{V}$ is closed under powersets and closed under unions. Contradiction (by Hilbert's Paradox). ■
